

## Safety and quality in employee competence

## Promote the expertise of your personnel with the training courses offered by Liftinstituut

Knowledge is required when designing, manufacturing and installing lifts and carriers. Knowledge of technology but also knowledge of applicable safety requirements as well as those currently being developed. Pure theory is not the only issue in relation to this: the capability of interpreting all legislation and regulations and to process this information into designs and risk analyses is just as important. A safe product is the number one priority but installing it efficiently is also important. A balanced price/performance ratio is also an issue to consider...

### Liftinstituut trains people based on experience

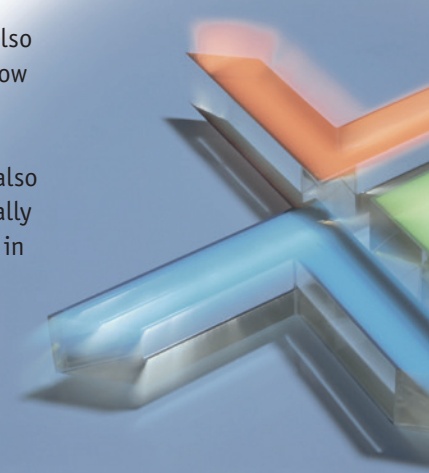

Attention is paid to all of the above aspects during the Liftinstituut training courses. As the European best known inspection body and knowledge centre for lifts, escalators and other technical installations, Liftinstituut is completely up to date regarding the latest developments in the areas of safety and technology. The training courses are given by professionals from the field which means that the content is always extremely current. This is your guarantee that we can train your design engineers, engineers and fitters based mainly on the practical perspective.

### Safe working environment after commissioning

There are also numerous employees that have to work in, around and on lifts and hoisting and lifting equipment after installation and commissioning. Examples are caretakers, cleaners, fire brigade people, window-cleaners and roofers. They must be able to perform their work safely as well. This not only requires reliable materials but also competence. Liftinstituut anticipates these needs with a complete range of practice-based safety training courses.

### Competence: a strong tool

The market recognises quality and makes selections based on this quality. This is certainly also the case in relation to the quality of competence. Employees that show that they exactly know how they must act, create confidence. The professionalism of companies that operate with perceptibly untrained employees, on the other hand, is quickly questioned. Apart from the statutory obligation to train employees appropriately, commercial strategic arguments are also involved which suggest that all the attention should be dedicated to this issue. Psychologically too: because employees perform better when they see that all that is possible is being done in the area of training and refresher courses.

### Three training formats

Liftinstituut offers courses and training sessions based on three educational formats. You can, therefore, determine which format fits your organisation the best. An up to date overview of all training courses is presented at [www.liftinstituut.com](http://www.liftinstituut.com).

#### ■ Open training courses

These traditional safety training courses take place at a central location on a date determined beforehand. This format with open registration is extremely suitable if only a limited number of employees are to participate. The related exercise material is available, if required, to ensure that what has been learned can be immediately applied to practical situations.

#### ■ In-company training courses

These safety training courses take place within your organisation (or at another location that you can determine) on a date specified by you. In-company training courses are recommended when four persons or more are to take part and are usually also less expensive. Travelling time is not involved and practical exercises are performed, if available, using the installations within your organisation. The student can, thus, for example, practice working safely in and around lifts. Many of the open training courses are also offered by Liftinstituut as in-company courses.

#### ■ Customised training courses

Since every organisation is unique, Liftinstituut offers the opportunity to create a customised training course. You can choose from twenty different lesson modules (refer to our website: [www.liftinstituut.com](http://www.liftinstituut.com)) which can be supplemented with other specific educational requirements within your organisation.

Liftinstituut provides more than two hundred training courses on an annual basis for Vodafone, ABP, UWV, Accor Hotels, Amsterdam Airport Schiphol, various fire brigades, universities, hospitals, housing corporations and many more similar organisations.

For lift manufacturers worldwide, we provide in-company and online courses (e-learning). Our most popular courses are:

- Working with the new lift standards EN 81-20 and EN 81-50
- PESSRAL Programmable Electronic Systems in Safety Related Applications
